

Node.js and Django

I used this website

<https://www.cuelogic.com/blog/how-to-use-both-django-nodejs-as-backend-for-your-application>

It is possible for both node.js and django to co exist on a web page, however the set up is difficult

They each have pros and cons

It seems as though node.js will be more appropriate for our needs, and myself and Josh are learning it in another class anyway so we will have more information on using it.

Retailer api:

<https://rapidapi.com/blog/directory/overstock-shopping/>

<https://developer.ebay.com/>

Ebay and overstock have readily available free apis that have a lot of documentation for.

After my research into the amazon api i found that it is a priced thing and was very confusion to use.
